Profile

Backend-focused developer building APIs, authentication, payments, and background-job workflows with Node.js, Express.js, TypeScript, and MongoDB. I've implemented Stripe payment flows, webhook handling, email automation, Redis/BullMQ queues, OAuth, and Supabase storage buckets across contract work and independent projects. I recently completed a Computer Science diploma at Abubakar Tafawa Balewa University and am open to backend-focused roles.

Education

Abubakar Tafawa Balewa University, Bauchi

Diploma in computer science, Jan 2023 to Oct 2025

Completed a two-year diploma program in Computer Science with an Upper Credit classification (4.2/5.0 GPA), covering foundational computing concepts and general computer studies. Graduated in October 2025.

Projects

True Love App

Tech Stack: *Node.js, MongoDB, Stripe, Redis, BullMQ*

Built and maintained the backend system for a production relationship-coaching platform, handling authentication, payments, background jobs, and system reliability.

Implemented Stripe payment flows, webhook handling, idempotency protection for safe payment retries, asynchronous email processing with BullMQ, and structured MongoDB models for transaction and user management.

Siwel Beats Platform

Tech Stack: *Node.js, TypeScript, MongoDB, Supabase, Redis, BullMQ*

Built the backend for a beat-selling and audio-streaming platform, handling authentication, track management, streaming logic, file uploads, and order processing.

Implemented features including Google OAuth, audio storage integration with Supabase, queue-based background jobs using BullMQ, and validation/security handling for scalable backend operations.

SVG Project Card API

Tech Stack: *Flask, GitHub API, SVG Rendering*

Built an API that generates dynamic SVG visualizations for GitHub repositories, designed for embedding in README profiles and websites.

Implemented repository fetching, theme customization, and dynamic SVG generation while learning backend development with Flask.

Portfolio Website V2

Tech Stack: *React, TypeScript, Framer Motion, Vite*

Designed and developed the second version of my developer portfolio using React and TypeScript, with a focus on cleaner architecture, improved UI structure, and responsive design. Implemented animated interfaces using Framer Motion and rebuilt the project to better reflect my transition toward backend-focused development.

Professional Experience

Developer & Technical Consultant (Contract), Exponential Enlightenment

2024 to Present

- Worked closely with the founder on product planning, technical architecture, and application workflows across multiple projects.
- Implemented backend integration work using Lovable and Node.js, including Stripe payment flows, email-sending workflows, serverless functions, notification flows, and backend service integrations.
- Contributed to rapid product development by shaping scalable feature structures for internal tools, landing pages, and digital product platforms.
- Supported technical decisions that improved reliability and development speed across fast-moving product iterations.

Backend Developer (Personal Projects), Independent

2022 to Present

- Built backend APIs and application logic with Node.js and MongoDB, focusing on authentication, data handling, and service integration.
- Implemented payments, file handling, background jobs, and scalable backend workflows across personal projects.
- Added practical backend features using Redis, BullMQ, Stripe, and Supabase.
- Strengthened my understanding of production-style backend development through iterative project work and experimentation.

Skills

• Node.js	• Express.js	• TypeScript	• MongoDB
• Redis	• BullMQ	• Stripe	• OAuth
• REST APIs	• JavaScript (ES6+)	• Python	• Flask
• Supabase	• React	• HTML5/CSS3	• Git & GitHub
• Linux	• PostgreSQL (basic)
